THU University of Limerick is leading the race to multiple sclerosis in an effort to understand the neurological condition better, and to find a cure. The university has signed up a new research programme, in conjunction with MS Ireland. The first phase of this research involves the investigation of several aspects of MS, and the understanding of those who have the condition, health professionals, and the general public. Currently, this research is taking place across a number of UL departments including, neurology, psychiatry, and computer engineering. Under this new agreement, research will be conducted at UL, and students will be involved in work on clinical trials, and activity monitors. While occupational therapy researchers and students have completed projects on fatigue management, MS Ireland and UL have successfully collaborated on significant research projects with ground-breaking and positive results for people with MS since 1999. The results of this project demonstrated a number of potential interventions, which are now being adopted across the public and private sectors in Ireland as best practice.
